PROBLEM STATEMENT
JOB MARKET ANALYSIS

The job market contains a large amount of data related to different **job roles, companies, locations, experience levels, salary ranges,** and **employment types.** The dataset includes fields such as job title, company, location, experience, minimum salary, maximum salary, and employment type.

1

LARGE AMOUNT OF JOB DATA

- Many job postings are available from different sources.
- It includes job title, company, location, experience, salary range, and employment type.

Why it is a problem?

Too much raw data is difficult to read, compare and understand directly. We need analysis to convert it into useful information.

2

DIFFICULTY IN UNDERSTANDING JOB DEMAND

- It is difficult to identify which job roles have more opportunities.
- Example: Data Analyst, Python Developer, Java Developer, Cloud Engineer, etc.

Why it is a problem?

Job seekers cannot easily know which job roles are in high demand by looking at individual job postings.

3

DIFFICULTY IN COMPARING LOCATIONS

- Jobs are available in different cities and remote locations.
- It is not easy to know which location has more job opportunities.

Why it is a problem?

Job seekers may not know where more opportunities are available for their preferred role.

4

DIFFICULTY IN UNDERSTANDING SALARY PATTERNS

- Salaries vary across job roles and experience levels.
- A fresher and an experienced candidate may have different salary expectations for the same role.

Why it is a problem?

Without analysis, it is difficult to understand the expected salary range for different roles.

5

UNDERSTANDING EXPERIENCE REQUIREMENTS

- The dataset contains experience categories: 0–2 Years, 2–5 Years, 5–8 Years, 8+ Years.
- It helps to understand opportunities for freshers, mid-level and experienced professionals.

Why it is a problem?

Job seekers are not sure which experience level is in demand and where they fit better.

6

EMPLOYMENT TYPE COMPARISON

- The dataset includes Full-time, Part-time, and Contract job types.
- We need to know which type of employment is more common.

Why it is a problem?

Without analysis, it is difficult to understand the availability of different employment types in the market.

7

COMPANY-LEVEL ANALYSIS

- Different companies provide different numbers of job opportunities.
- We need to identify companies with more job postings and compare opportunities.

Why it is a problem?

Job seekers may not know which companies are actively hiring and offer more opportunities.

8

NEED FOR MEANINGFUL INSIGHTS

- Raw data alone does not provide clear understanding of the job market.
- Data needs to be cleaned, analyzed, compared and visualized.

Why it is a problem?

Without proper analysis and visualization, important patterns and trends cannot be identified easily.

The job market generates a large amount of data across different job roles, companies, locations, experience levels, salary ranges, and employment types. However, raw job-market data is difficult to interpret and compare directly. Job seekers may struggle to identify high-demand roles, suitable locations, expected salary ranges, required experience levels, employment types, and companies offering more opportunities. Therefore, this project aims to **analyze job-market data**, identify important **patterns and trends**, and convert the raw data into **meaningful insights** that can support **better understanding** of job opportunities and **career decision-making**.
